

PRESS RELEASE

“Quick link” marine theft protection products by STAZO introduced at METS 2007.

STAZO marine equipment b.v. in the Netherlands has developed a few new unique mechanical (marine) theft protection products. The so called “quick link” theft protection products are based upon the experience and expertise of being a major manufacturer of mechanical marine theft protection products for over a decade. The “quick link” theft protection products have been developed for vessels in the first place, for (water) scooters, (water) bikes, ATV’s, golf cars, generator sets and so on and for all kinds of (marine) accessories and all types of (marine) equipment.

The new STAZO “quick link”(marine) theft protection products are made of stainless steel AISI 316 and are based upon a “quick link” technology. This “quick link” technology is incorporated into this new product line and will be incorporated in the new theft protection products to come. The STAZO experience and expertise has been used to produce a long list that included all technical and practical requirements of our world wide customers, official international authorities and insurance companies.

SPARK design engineering b.v., one of the leading industrial design companies in the Netherlands, has turned this long list of requirements into some nice looking and practical “quick link”(marine) theft protection products. Of course all products are designed all strict and specific requirements for international approval and certification. For model protection is applied and patents are pending.

Quality marine equipment since 1931
